

ABSTRACT

An embodiment of the present invention for the first time includes a television and a remote control for the television, with an activator installed in the television at the time of manufacture, and with a locator signal generator, which may be a beeper, a flashing light, or other device, installed in the remote control at the time of manufacture. Using the activator in the television will activate the locator signal generator in the remote control. The resulting signal, which may be a sound, or a flashing light, or both, or another signal, enables the user to locate the remote control. The activator wirelessly communicates to the signal generator to activate the signal generator.
